

Name: _____

Crystal Observation

Instructions:

1. Your observations will begin after you have made the solutions for your crystals.
2. Allow your crystals to sit untouched for 24 hours.
3. On day 1 of your observations remove your crystals carefully and draw a picture. Write any observations about the crystals, the container they were in, and the solution.
4. Carefully pour the crystal solution into another container and scrape any residue off of the container you have been growing the crystals in.
5. Pour the crystal solution back into the container and replace your crystal, allowing it to stay in the solution for another 24 hours.
6. On day 2 remove your crystals once again and record your observations. You may dispose of the solution and allow your crystals to dry for another 24 hours.

Draw a picture of what your crystals look like each day
